

# Sequence Diagram Tutorial

From:

*UML Distilled, Third Edition*, Chapter 4

M. Fowler

# Use Cases and Scenarios

- A **use case** is a collection of interactions between external actors and a system
- In UML, a use case is “the specification of a sequence of actions, including variants, that a system (or entity) can perform, interacting with actors of the system.”
- Typically each **use case** includes a primary **scenario** ( or main course of events) and zero or more secondary **scenarios** that are alternative courses of events to the primary **scenario**.
- **Then:** A **scenario** is one path or flow through a **use case** that describes a sequence of events that occurs during one particular execution of a system.

# UML Sequence Diagrams

- Describe the flow of messages, events, actions between objects
- Show concurrent processes and activations
- Show time sequences that are not easily depicted in other diagrams
- Typically used during analysis and design to document and understand the logical flow of your system

**Emphasis on time ordering!**

# Sequence Diagram Key Parts

- **participant**: object or entity that acts in the diagram
  - diagram starts with an unattached "found message" arrow
- **message**: communication between participant objects
- the **axes** in a sequence diagram:
  - **horizontal**: which object/participant is acting
  - **vertical**: time (down -> forward in time)

# Representing Objects

Squares with object type, optionally preceded by "*name* :"

- write object's name if it clarifies the diagram
- object's "life line" represented by dashed vert. line

**Name syntax:** <objectname>:<classname>

# Messages Between Objects

**messages** (method calls) indicated by arrow to other object

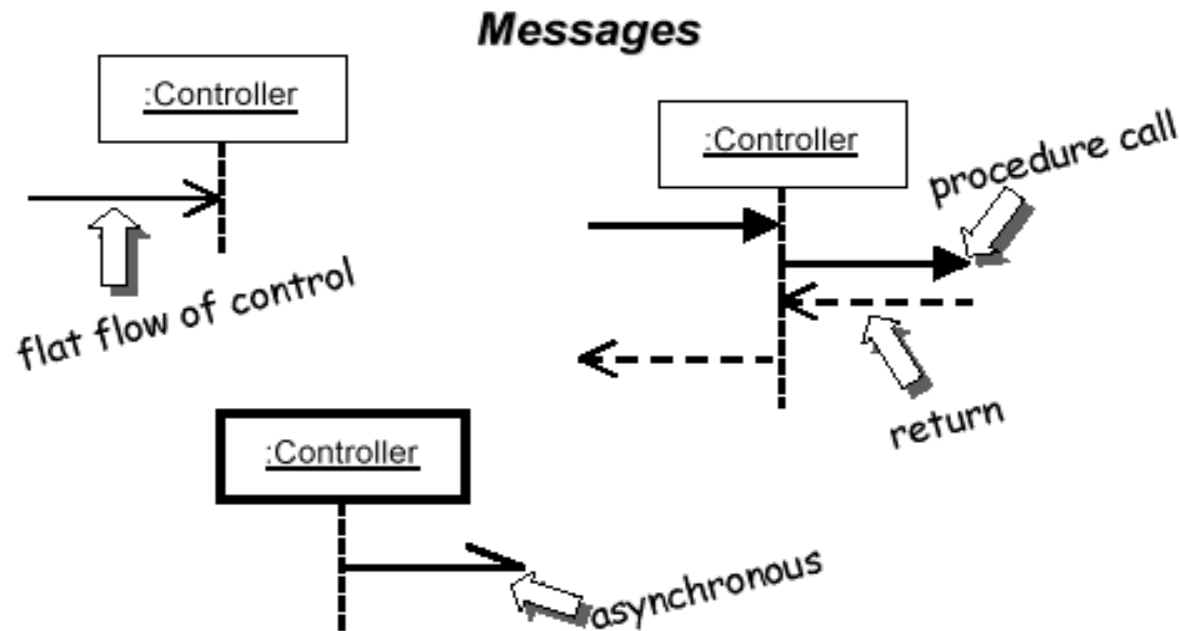

- write message name and arguments above arrow

# Messages, continued

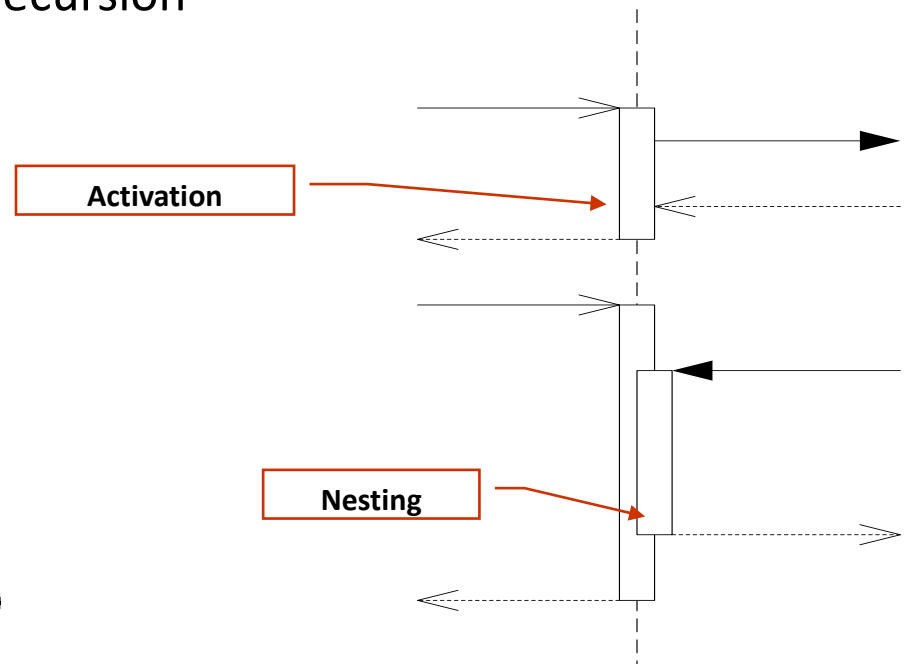

**messages** (method calls) indicated by arrow to other object

- dashed arrow back indicates return
- different arrowheads for normal / concurrent (asynchronous) calls

# Indicating method calls

- **activation**: thick box over object's life line; drawn when object's method is on the stack
  - either that object is running its code, or it is on the stack waiting for another object's method to finish
  - nest activations to indicate recursion

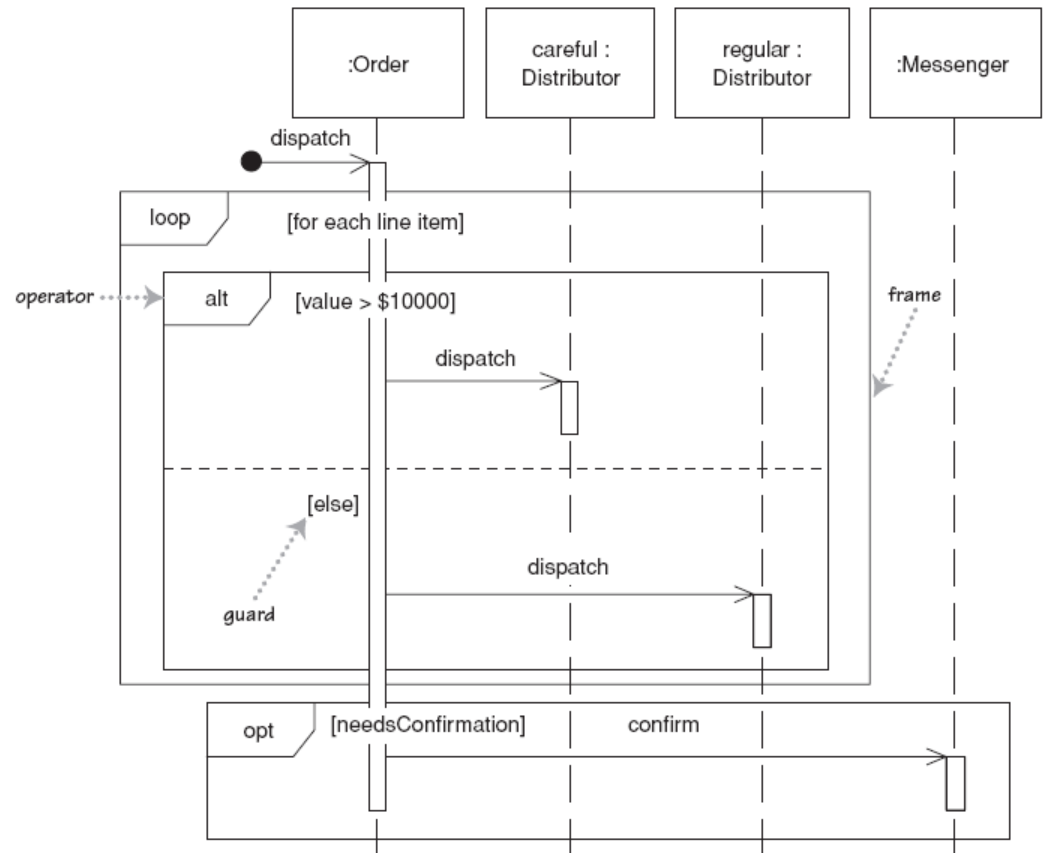

# Selection and loops

**frame:** box around part of diagram to indicate `if` or `loop`

- `if` → (opt)  
[condition]
- `if/else` → (alt)  
[condition], separated by horizontal dashed line
- `loop` → (loop)  
[condition or items to loop over]

# Sequence diagram from use case scenario

# Why not just code it?

- Sequence diagrams can be somewhat close to the code level.
- So why not just code up that algorithm rather than drawing it as a sequence diagram?
  - a good sequence diagram is still a bit above the level of the real code (not all code is drawn on diagram)
  - sequence diagrams are language-agnostic (can be implemented in many different languages)
  - non-coders can do sequence diagrams
  - easier to do sequence diagrams as a team
  - can see many objects/classes at a time on same page (visual bandwidth)
